

Constructor

Agenda

- What is a constructor?
- Why do we use constructor?

Constructor is a special function that is called implicitly when the object of a class is created

Constructor is used to create and initialize the attributes.

Defined as `__init__()`

First parameter in constructor is always self that holds the instance for which constructor is called

Summary

- Constructor is a special function that is called implicitly when the object of a class is created
- It is used to create and initialize the attributes.
- Its is predefined as `__init__()`
- First parameter in constructor is always self that holds the instance for which constructor is called
